

Technical Comments/Response

9) The tune up procedure suggests 3 frequencies are selected and implies that the user may select/program frequencies outside of the range, but to meet FCC regulations that they should select only channels 16 – 223 should be used. The test report mentions 3 discrete frequencies and that the user can not adjust these. Kindly note that the user should not have any ability to operate or select channels outside of what is authorized for FCC. Kindly see 15.15 for further information. Please clearly explain how this device will be capable of meeting this once placed on the U.S. market.

The ability to set the channel frequencies is only achievable by a special program that only we IceRobotics have access to. Once the IceReader ships it is impossible for any user to change these frequencies. The application referred to in the tune up procedure is a custom internal application used for debugging, product enhancement and product configuration prior to shipping.
